Security Levels in AEOS

Respond to incidents with one click

Take the right action, immediately

In an emergency, a quick response can make a huge difference. But time is often wasted opening or locking doors manually or withdrawing the access rights of individual people. On the other hand, some responses to emergencies can be excessive. If an incident only affects a specific area or group of people, for example, it's inconvenient if your only available quick response is to block everyone.

With AEOS Security Levels, you can quickly switch to a different access mode or security level. So you can keep full control of access to your buildings and grounds during an incident, without disrupting the entire business.

Security Levels is ideal for:

- Large companies operating in several locations, regions or countries.
- Organisations with large and complex employee and visitor flows.
- Businesses that need extra security because of the hazardous or valuable commodities they deal with.

'Be prepared for every security situation thrown at you'

Define scenarios in advance

If you define scenarios with different authorisation needs in advance, it then only takes a couple of seconds to switch to the right security level for the threat you face. You can even add verification, Anti Passback or a headcount to certain access points. And you can create an unlimited number of scenarios, so you can define the right response for each possible incident.

Emergency situations

If there's an incident that means the building must be evacuated, you can change your access control settings instantly with AEOS Security Levels. Select an evacuation security level that you've defined previously, and employees will only be allowed to leave, not enter, the building. This does not apply to emergency response teams though – you can set AEOS so they're allowed full access at all times. While you're activating your selected security level, AEOS can be automatically printing a list of people present.

When there's a strike

During a labour strike, you might only want higher management and your security team to access certain areas of the building and grounds. Using AEOS Security Levels, you can easily define a scenario that gives special access rights to specific people and blocks off certain areas to everyone else.

During a riot

If there's a violent demonstration nearby, you can use AEOS Security Levels to respond quickly and seal off the perimeter of your grounds.

'Being able to respond quickly in an emergency can save lives'

Special opening hours

Say, for example, your building is usually closed on Sundays but you open on two Sundays each year. You could manually adjust your standard time templates for these two occasions. With AEOS Security Levels, however, you can easily switch to a scenario that you've created for this situation. Your 'open Sunday' scenario will define the access points and the people who have access during these special opening hours.

When you want to empty the car park

You can also use AEOS Security Levels if you need to empty your car park. It allows you to easily adjust the settings so cars can only leave the car park and not enter it.

Extra peace of mind in stressful situations

With AEOS Security Levels, you stay in control of who enters your grounds and buildings, at all times. It gives you less to think about in situations where you have lots to do and have to take action quickly.
