When you need a new access control system, we make the switch easy

In partnership with Flitch

Stranded with a security system at the end of its life?

Many years ago, you invested in modern access control. Your system's still operating, but it's become outdated and is no longer eligible for technical support. Malfunctions are creeping in and no further security patches are offered to help protect you against ever-growing cybersecurity threats.

An opportunity to reinject value

Sounds familiar? If so, now's a great time to switch to a new access control system that offers you wide-ranging value for the long-term. Nedap's AEOS access control system uses the latest technology and can be easily adapted to meet your organisation's evolving needs. AEOS's functionality goes far beyond just opening doors, offering higher security and a strong, enduring return on investment.

But how do you make the change?

Get expert support from industry specialists

If you like the idea of migrating to a modern access control system but are concerned about the process, Flitch Technical Services are the people to turn to. They have over 25 years' experience in the physical security industry and intimate technical knowledge of access control systems.

Nedap has partnered with Flitch to make life easier for companies left wrangling a legacy or end-of-life access control system that may also have complex integrations.

Migrating to AEOS access control is seamless

Flitch offers a service to migrate your access control to AEOS and their exceptional expertise helps to make the process pain-free. They can:

- Cleanse your access control data.
- Import your data into AEOS programmatically.
- Provide reporting services that interlace data from your old system to AEOS.
- Integrate your existing access control system with AEOS to ensure there's no downtime and access control cards (or other identifiers) only need to be registered once.

Potential issues you can avoid

With Flitch's support and AEOS's flexibility, you won't need to worry about:

- Manually transferring cardholder data into AEOS (and potentially making errors).
- Implementing a long change freeze to avoid data integrity issues.
- Duplicating data entry into two systems running in parallel for an extended period.
- Straddling two systems to monitor your estate.

Why switch to AEOS?

✓ Proven and tested migration path

Flitch has a well-tested methodology to seamlessly migrate existing data from end-of-life systems into AEOS.

✓ Open architecture gives endless potential

AEOS is based on open standards and so offers great flexibility, scalability and functionality. It's this open architecture that's enabled Flitch to develop a direct path for smooth migrations.

✓ Numerous opportunities to integrate and adapt

AEOS offers a vast array of integration and configuration options, and links easily to systems such as intrusion detection, video management and your HR database. Even if your existing access control system has bespoke integrations engineered for your specific needs, AEOS allows you to maintain and improve them.

✓ Use both modern and traditional technology

With AEOS, you can take advantage of newer forms of identification that offer greater convenience and security, such as a mobile phones and biometric data. But you can continue to use traditional access cards if you choose.

✓ There's no end of life for AEOS

One of our core aims at Nedap is to provide access control systems with no end of life. AEOS was first launched 20 years ago and is still the leading access control platform across Europe because we're committed to continually investing in its development.

Choose AEOS, and you'll never have to migrate to a new access control system again.
